Solana Validator & Governance Power Analysis

I tried to expose the hidden concentration of power that undermines Solana's decentralization. Using **static data** from [Solana \(17/04/2025\)](#), [Cosmos \(28/04/2025\)](#), [Polkadot \(28/04/2025\)](#) and analysis focused on the top 10 validators.

This dashboard tries to prove and measure the extent to which the dominance of validator stake pools affects the network.

Look at my Research Article used this dashboard: [🔗](#)

Governance Power at SIMD-098, SIMD-123, SIMD-228

- SIMD-098 proposal prioritizes Solana's data-splitting protocol based on validator stake weights, with a majority result status of agree. This proposal can reduce latency for high-stake validators and increase network speed.
- SIMD-123 seeks to modify block fees by requiring validators to distribute a portion of transaction costs and priority tips to stakers, with a majority result status of agree.
- SIMD-228 wants to change the fixed inflation model to be dynamic according to the staking participation rate. If the stake rate reached 65% then annual SOL inflation would be reduced to below 1%. The proposal was rejected as it did not pass the threshold of 75% yes.

@wajimaa

Comparative Stake Distribution

The goal is to understand where the Solana network stands, test the hypothesis that other networks may have similar patterns due to favorable architectural design and other reasons.

Stake Distribution gini_co...

0.703

Gini Coefficient

@wajimaa

5d

SIGN UP
Cosmos has a relative managing stake distr achieves a 0.703 Gini While Solana with a t validators gets a 0.9 coefficient, this value indicating many smal with a small number assets

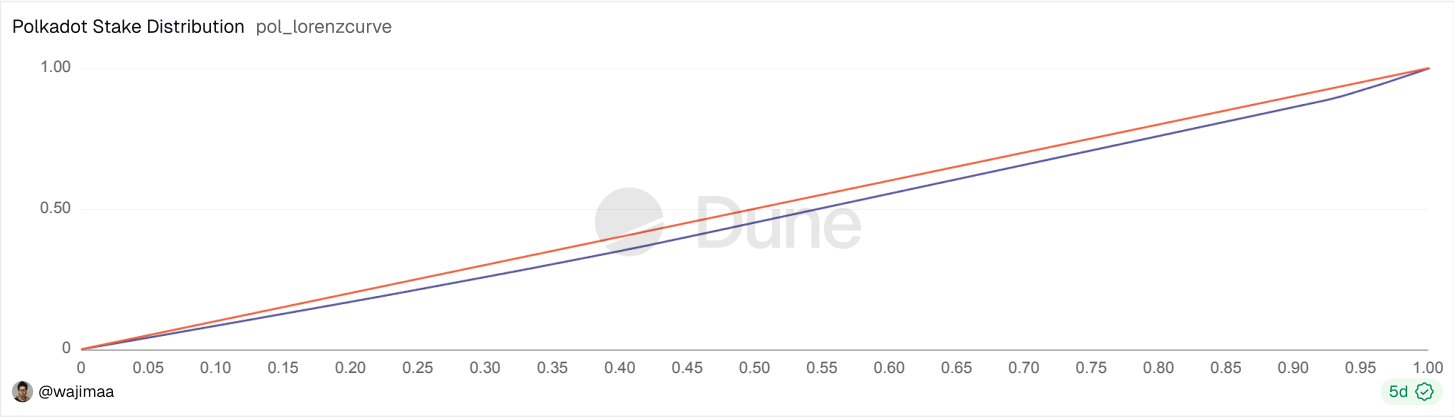

Polkadot Stake Distribution gini_d...

0.074

Polkadot Stake Distribution

@wajimaa

5d

Polkadot network is t managing stake pool: >50% with gini coeffi makes Polkadot faire stake pools even tho fewer validators
